The Frigidaire dishwasher inside diagram breaks down the appliance into distinct sections, highlighting the location and function of each part. This section elaborates on the components shown in the diagram and their significance.

Dishwasher Tub and Racks

The tub forms the central chamber of the dishwasher, housing the dishes during cleaning. The upper and lower racks slide in and out for easy loading and unloading of dishes. The inside diagram clearly marks the positioning of these racks relative to other components.

Spray Arms and Water Distribution System

Spray arms are pivotal for dispersing water and detergent throughout the dishwasher. The diagram illustrates the placement of upper and lower spray arms, showing how water is sprayed at high pressure to remove food particles effectively.

Filtration System and Drainage

The filtration system, including coarse and fine filters, traps food debris to prevent clogging of the drainage system. The diagram details the filter location near the bottom of the tub, as well as the drainage pump that expels dirty water out of the dishwasher.

Heating Element and Drying Mechanism

The heating element, typically found near the base of the tub, heats the water during wash cycles and assists in drying dishes afterward. The diagram pinpoints its exact location to help with inspection or replacement.

Motor and Pump Assembly

The motor powers the pump, which circulates water through the spray arms and drains used water. The inside diagram outlines how these components are interconnected beneath the tub for efficient operation.

Control Panel and Electronic Components

Functions of Key Internal Parts

Understanding the function of each internal part detailed in the Frigidaire dishwasher inside diagram is critical for effective use, troubleshooting, and repair. This section describes the role of key components in the dishwasher's operation.

Spray Arms

Spray arms rotate to distribute water evenly across dishes. They operate under pressure generated by the pump, ensuring thorough cleaning by reaching every corner of the dishwasher interior.

Filters

Filters prevent food particles from recirculating and clogging the drainage system. Regular cleaning of these filters, as indicated by their position in the inside diagram, is necessary to maintain optimal dishwasher performance.

Heating Element

The heating element raises water temperature for effective cleaning and sanitization. It also facilitates drying by heating the air inside the dishwasher once the wash cycle concludes.

Motor and Pump

The motor drives the pump, which controls water flow into the spray arms and drainage system. Proper functioning of these parts ensures the dishwasher completes wash and drain cycles efficiently.
