Frequently Asked Questions

What is the formula to find the area of a triangle in 7th grade math?

The formula to find the area of a triangle is $(1/2) \times \text{base} \times \text{height}$.

How do you solve a linear equation in one variable?

To solve a linear equation, isolate the variable by performing inverse operations on both sides until the variable is alone.

What is the Pythagorean theorem?

The Pythagorean theorem states that in a right triangle, $a^2 + b^2 = c^2$, where c is the hypotenuse.

How do you find the mean, median, and mode of a data set?

Mean is the average of all numbers, median is the middle value when numbers are ordered, and mode is the most frequently occurring number.

What is the difference between an expression and an equation?

An expression is a combination of numbers and variables without an equals sign, while an equation has an equals sign showing two expressions are equal.

How do you convert fractions to decimals?

Divide the numerator by the denominator to convert a fraction to a decimal.

What are integers and how are they used in 7th grade math?

Integers are whole numbers including negatives, zero, and positives, used for operations like addition, subtraction, and solving equations.

How do you calculate the volume of a rectangular prism?

Volume = length $\times$ width $\times$ height.

What is the rule for multiplying positive and negative integers?

Multiplying two numbers with the same sign gives a positive product; with different signs, the product is negative.
