Geographical and Geological Features of Medicine Lake

Medicine Lake is situated in the Canadian Rockies within Jasper National Park, Alberta, Canada. This lake is distinctive due to its fluctuating water levels, which are influenced by an underground drainage system. Unlike typical lakes that have visible outflows, Medicine Lake's water drains through subterranean channels in the karst landscape, causing its surface area to vary dramatically throughout the year.

Location and Surrounding Environment

Medicine Lake lies approximately 30 kilometers north of Jasper townsite, nestled in the Athabasca Valley. The surrounding environment is characterized by rugged mountain peaks, dense coniferous forests, and alpine meadows. The lake sits at an elevation of around 1,300 meters, contributing to its cool climate and pristine water quality.

Unique Hydrology and Geology

The lake's hydrology is governed by a complex system of limestone caves and underground channels.
