Overview of the Predictive Index Assessment

The Predictive Index assessment is a popular tool used by organizations to measure candidates' behavioral drives and cognitive abilities. It consists of two primary components: the Behavioral Assessment and the Cognitive Assessment. The Behavioral Assessment focuses on identifying an individual's natural behavioral tendencies, while the Cognitive Assessment evaluates general mental agility and problem-solving skills. Employers use the results to predict workplace behaviors and determine the best fit for specific roles. Understanding the structure and objectives of the PI assessment is crucial for effective preparation.

Types of Predictive Index Sample Questions

Predictive index sample questions typically fall into two main categories aligned with the assessment's components: behavioral questions and cognitive questions. Behavioral questions assess personality traits by asking

candidates to select adjectives that describe themselves or how others perceive them. Cognitive questions test verbal, numerical, and abstract reasoning abilities through timed problem-solving tasks. Familiarity with these question types helps candidates anticipate what to expect and tailor their preparation accordingly.

Behavioral Assessment Questions

Behavioral questions in the Predictive Index assessment require candidates to choose descriptive words from a list that best characterize their natural behavior and work style. This section measures traits such as dominance, extraversion, patience, and formality. Candidates are often asked to select adjectives that they believe describe themselves as well as those that describe how they think others expect them to behave in a work environment.

Cognitive Assessment Questions

The cognitive portion includes questions designed to evaluate mental agility, including numerical reasoning, verbal reasoning, and abstract reasoning. These questions are usually timed and require quick thinking and logical analysis. The cognitive assessment aims to understand how well candidates learn, adapt, and solve problems in the workplace.

Examples of Behavioral Assessment Questions

Behavioral assessment questions in the Predictive Index test typically present a list of adjectives, from which candidates must select those that best describe their behavioral tendencies. The goal is to capture an accurate picture of one's natural workplace behavior.

1. Select the adjectives that best describe how you behave in your natural work environment.
2. Choose the adjectives that describe how others expect you to behave at work.

Example adjectives might include:

- Assertive
- Reserved
- Patient
- Detail-oriented

- Collaborative

These selections help employers understand personality dimensions such as dominance, extroversion, steadiness, and compliance.

Examples of Cognitive Assessment Questions

The cognitive assessment portion tests problem-solving ability and mental quickness. Sample questions often include numerical sequences, verbal analogies, and pattern recognition.

- **Numerical Reasoning:** Identify the next number in the sequence: 2, 4, 8, 16, ?
- **Verbal Reasoning:** Choose the word that best completes the analogy: Book is to Reading as Fork is to _____.
- **Abstract Reasoning:** Select the figure that completes the pattern in the series.

Cognitive questions are typically timed, requiring candidates to process information quickly and accurately.
